Day 5 – Assignment

This task helps you become familiar with the fundamentals of JavaScript by enhancing a web page to provide JavaScript functionality.

Due

This assignment does not need to be handed in. Your instructor will review it the next morning so you can ask questions and get assistance with any problems you might encounter. You will build onto this assignment in the remaining assignments of this course. If you want feedback on your code you can ask your instructor to check it and give advice. You will be required to hand in the cumulative code after day 8 for marking. Your instructor will set the due date for you.

Directions

In this exercise you will customize the web pages you have been working on earlier in this course and enhance the page to provide JavaScript functionality.

1. Set up a web form for customers to enter their name, address, city, province, postal code, and anything else that you want to include.
2. Modify your web form to ask for confirmation before submitting or resetting. Put an onClick event handler on the submit and reset buttons of the form. When these buttons are clicked, confirm dialogs should pop open asking them if they really want to do this. If the user clicks "ok", the submit or reset continue, otherwise they should be cancelled.

Feedback:

If you have any questions or wish to get some feedback on your work before the hand-in date, ask your instructor to review it with you after class.
